Summary

Frontend engineer with **4+ years** in React and Next.js, mostly on data-heavy B2B products — dashboards, real-time UIs, and analytics tools. I focus on performance: Lighthouse scores, bundle sizes, and keeping API calls efficient. Currently spending most of my time in Next.js App Router and TanStack Query.

Experience

- **Pixel Consultancy** Jul 2025 – Present
Software Engineer Kolkata, WB
 - Migrated key pages to **Next.js 14 App Router** with SSR, cutting TTFB by 35% — the primary ask from the client going into the project.
 - Refactored the API layer with **TanStack Query** (per-module cache keys and stale times), bringing network traffic down 40% on the busiest screens.
 - Built a shared component library now used across 5+ product modules; features that previously took a full sprint to scaffold get done in a couple of days.
 - Shipped a real-time availability checker using polling + stale-while-revalidate — staleness dropped from up to 3 minutes down to under 30 seconds.
 - Enforced TypeScript strict mode; coverage went from 60% to 95%+ and is now a standard item in our PR checklist.
- **Aggregate Intelligence** Jun 2024 – Jun 2025
UI Developer Coimbatore, TN
 - Built data-intensive dashboards in **React + Material UI** for enterprise clients — handled 10K+ row tables without jank using virtualised rendering.
 - Introduced route-based code-splitting and lazy loading across a bloated bundle, bringing JS size down 45% and LCP from around 4s to under 2s.
 - Wrapped 8+ REST endpoints in custom Axios hooks; API-related bug reports dropped noticeably in the sprints after the refactor shipped.
- **Pando India Software Consultants** Sep 2022 – Jun 2024
Software Engineer Noida, UP
 - Delivered 10+ production features in **React + TypeScript** for a logistics platform, translating messy shipment-state domain rules into UIs ops staff could use without training.
 - Tightened TypeScript coverage across an under-typed codebase — cut a whole class of runtime bugs and made it easier to onboard new engineers.
 - Replaced 4 hand-rolled forms with one configurable system; new forms take about half the time to build and the team adopted it as the default going forward.
- **NMS Games Pvt. Ltd.** Nov 2021 – Jun 2022
Jr. Backend Developer Noida, UP
 - Replaced the legacy PHP-rendered frontend with **React + Redux** — page loads went from slow to near-instant and the whole dashboard became SPA-style navigation.
 - Maintained Node.js/SQL APIs feeding game stats into the dashboard; stable under ~500 concurrent users during peak match windows.

Technical Skills

- **Frontend:** React.js, Next.js (App Router), Redux Toolkit, Zustand, Tailwind CSS, Material UI
- **Languages:** TypeScript, JavaScript (ES2022+), HTML5, CSS3
- **Performance & Data:** Core Web Vitals, Code Splitting, Lazy Loading, TanStack Query, REST APIs, Axios, WebSockets
- **Testing & Tools:** Jest, React Testing Library, Vitest, Git, Vite, Webpack, Vercel, Docker (basic), Figma, JIRA

Projects

- **Stortrack.com** — React, Redux, ApexCharts, Mapbox GL JS Live: stortrack.com
 - Built a multi-filter search with Redux-persisted state — users stopped re-running the same searches between navigations, and repeated API calls dropped about 30%.
 - Solved ApexCharts freezes on 50K+ record datasets by batching data through a chunking layer before render — PDF exports that used to time out now finish reliably.
 - Added Mapbox GL JS clustering for 10K+ store pins; without it the map was unusable at scale, with it interaction feels instant at any zoom level.
- **Earningsbeats** — React, TypeScript, Tailwind CSS, TanStack Query Portfolio: irahulks.com
 - Designed RBAC across 3 user tiers with protected route wrappers and session-aware rendering — each tier sees only its relevant data and actions.
 - Took Lighthouse performance score from 58 to 91 using React.lazy, Suspense boundaries, and TanStack Query prefetching — load time down about 40%.

Education

- **Bengal College of Engineering and Technology** 2016 – 2020
B.Tech in Mechanical Engineering — CGPA: 7.33 Durgapur, WB
